IT Labs

Prepared by Garrick White

4.4 Resolve PC Hardware Support Tickets

It is another busy day at the IT helpdesk. Three employees have submitted high-priority tickets because they cannot get their computers to work properly.

To complete this lab, view each ticket in Issue Trax on the ITAdmin computer.

Troubleshoot each problem and implement a solution. A problem will be considered solved when the Windows operating system is displayed on the computer's monitor.

Write a polite and professional comment on each ticket describing the actions taken, then close the tickets.

Complete this lab as follows:

1. Open the company's help desk ticketing system, **Issue Trax**.
 1. From the taskbar, select **Start**.
 2. Select **All apps**.
 3. Select **Issue Trax**.
 4. Maximize the window for better viewing.
2. Fix the problem in the executive office.
 1. Select and read **Ticket 11**.
 2. At the top left of the screen, select **Floor 1 Overview**.
 3. Select the **Hardware** view of the Executive Office.
 4. If you press the power button, the computer fails to turn on. Click **OK** to close the message.
 5. Zoom in on the surge protector. Notice that the power switch is turned off. It looks like the user accidentally bumped it with his foot.
 6. Click the **power switch** to turn it on.
 7. Press the **power buttons** on the computer and monitor. If a popup message appears, click **OK** to close it.
 8. Go back to the ITAdmin computer in the IT Administration Office.
 9. Type a polite and professional comment explaining what you did in the New Comment field, then press the **plus icon**.
 10. At the top of the screen, set the ticket to **Closed**.
 11. Click the **left arrow** to go back to the main view.
3. Fix the problem in Office 2.
 1. Select and read **Ticket 12**.
 2. At the top left of the screen, select **Floor 1 Overview**.
 3. Select the **Hardware** view of Office 2.
 4. Press the power button on the computer. This leads to a black screen and makes a beeping noise.
 5. Select **Office 2** at the top of the screen to go back to the hardware view.
 6. Power off the computer to stop the beeping. A beeping noise means there's a problem with RAM.
 7. Switch to the **Motherboard** view of the computer.
 8. Notice that this computer has no RAM. If this were real life, you'd want to report the apparent theft of company hardware.
 9. Expand **Memory** in the Inventory and drag the two **RAM sticks** to the orange RAM slots on the Motherboard.
 10. Switch to the **Front** view of the computer and press the **power button**. The computer turns on.
 11. Go back to the ITAdmin computer in the IT Administration Office.
 12. Type a polite and professional comment explaining what you did in the New

- Comment field, then press the **plus icon**.
13. At the top of the screen, set the ticket to **Closed**.
 14. Select the purple left arrow to go back to the ticket queue.
4. Fix the problem in Office 1.
1. Select and read **Ticket 13**.
 2. At the top left of the screen, select **Floor 1 Overview**.
 3. Select the **Hardware** view of Office 1.
 4. If you toggle the computer power off and on, it will confirm that the computer is running, but there is no signal to the monitor. Click **OK** to close the message.
 5. Switch to the **Back** views of the computer and the monitor.
 6. Select the HDMI cable on the back of the monitor. Notice that the other end of the cable is unconnected.
 7. In the Selected Item pane, drag the unconnected **HDMI connector** to the HDMI port on the back of the computer.
 8. If you switch to the front view of the monitor, you'll see that it's now working properly.
 9. Go back to the ITAdmin computer in the IT Administration Office.
 10. Type a polite and professional comment explaining what you did in the New Comment field, then press the **plus icon**.
 11. At the top of the screen, set the ticket to **Closed**.
